

Coin Railz

USDC-native payment infrastructure
for AI agents & cross-chain commerce

Circle-focused deck • SAFE Offering – 2026

The structural shift

- Agents transact programmatically — payments must be machine-native
- Data, compute, and services are moving to on-chain settlement
- Multi-chain ecosystems fragment liquidity & identity
- Legacy rails can't settle 24/7 or natively on-chain

Programmable digital dollars become the default settlement layer.

Why USDC wins the payment layer

- Regulated, fully-reserved digital dollar
- Native issuance across major chains
- Developer-first primitives (wallets, APIs, settlement)
- Built for institutional-grade compliance and scale

Coin Railz is designed to drive USDC velocity, not speculation.

How Coin Railz works

Simple, verifiable, pay-per-call settlement in USDC.

What we've built (live)

- 58 USDC-settling x402 microservices in production
- Multi-chain USDC acceptance (Ethereum, Base, Solana)
- Discovery manifests + programmatic payment verification
- Coinbase ecosystem indexing/discovery traffic already active

This is working infrastructure with real on-chain payments.

Early traction (production)

58

USDC services

317

payments

\$262

USDC volume

13,287

x402 interactions / 30d

643

unique IPs / 30d

2,327

agents discovered

Focus: convert discovery → paid usage via onboarding + distribution.

USDC settlement across chains

CCTP unlocks chain-agnostic pay-in with chain-agnostic settle-out.

Why Circle should care

- Real USDC demand generation: every call settles in USDC
- A production proof-point for Circle's programmable dollar narrative
- A natural CCTP integration customer (multi-chain in production)
- A distribution wedge into agentic commerce & machine payments

We want to be a featured USDC + x402 case study and scale together.

Competitive Landscape

- Stripe / traditional fintech → Fiat-centric, not machine-native
- Retail on-ramps → User acquisition tools, not programmable settlement layers
- Exchanges → Trading infrastructure, not agent-first payment rails
- API marketplaces → Lack native USDC settlement logic
- Coin Railz → USDC-native programmable settlement layer for autonomous commerce

Execution & Risk Acknowledgment

- Converting discovery traffic into sustained paid usage is the core execution challenge
- Embedded fiat → USDC on-ramp integration must be completed
- Cross-chain settlement (CCTP) integration is a strategic priority
- Developer adoption and ecosystem distribution drive scale
- Primary KPI: measurable USDC transaction velocity growth

Coin Railz as a USDC Demand Engine

- AI agents transact in stable units (not volatile tokens).
- USDC is the machine-native dollar.

Coin Railz creates:

- Programmatic USDC velocity through production microservices
- Cross-chain USDC routing (CCTP-ready flows)
- Embedded fiat→USDC on-ramp demand (wallet acquisition)
- Recurring micro-transaction volume (high-frequency, low-ticket)

Primary output:

Sustained, organic USDC transaction growth across chains.

Strategic alignment with Circle

- CCTP: cross-chain pay-in/pay-out for agent workflows
- Circle Wallets: faster wallet provisioning & onboarding
- Gateway / ecosystem distribution: convert discovery into volume
- Co-marketing: production metrics + case study

Ask: technical enablement + ecosystem support to accelerate USDC velocity.

Regulatory & Operational Foundation

Built with compliance-first operating discipline:

- Alabama Money Transmitter License (Kellogg Holdings LLC)
- Principal-to-principal digital asset settlement experience
- U.S. banking relationships and operational controls
- Clear separation of operating vs. client fund flows

Monetization model

- Micro-fees on x402 endpoint usage (USDC)
- Fiat → USDC on-ramp margin (embedded flow)
- Cross-chain settlement routing (CCTP-enabled)
- Future enterprise API licensing

Revenue scales with USDC payment volume & endpoint usage.

12-month roadmap

- Embed fiat → USDC on-ramp (keep user on Coin Railz)
- Integrate CCTP for seamless cross-chain settlement
- Improve agent onboarding + increased payment conversion
- Expand catalog: more USDC endpoints & enterprise-grade SLAs

Primary KPI: USDC transaction velocity through production endpoints.

SAFE offering - Coin Railz LLC

Target raise: \$1,000,000

Valuation cap: \$10,000,000

Use of funds:

- On-ramp integration + distribution
- Engineering capacity
- Developer growth + partnerships
- Compliance expansion

Vision

Build the default USDC-native payment layer for autonomous commerce.

Long-term outcomes:

- Strategic acquisition by payments/crypto infrastructure
- Deep ecosystem integration with Circle
- 9-10 figure platform value as USDC velocity scales

Founder

Travis Kellogg

- Founder, Coin Railz LLC; Executive Director, Kellogg Holdings LLC
- Alabama Money Transmitter License holder (KHLLC)
- Built Coin Railz: production USDC-first x402 microservice catalog across Ethereum, Base, and Solana
- Background: MBA (Marketing) – Clark Atlanta University; BSBA (Finance) – Stillman College
- Experience: business development, compliance-first fintech operations, and principal-to-principal digital asset settlement
