

Coin Railz Strategic Analysis

Executive summary

The public evidence suggests that Coin Railz has built something **real**, but not yet something the market can easily **categorize, trust, and buy at scale**. The core promise on the homepage is now much sharper than a generic crypto-fintech message: Coin Railz presents itself as “Payment Infrastructure for AI Agents,” says agents can buy paid data autonomously, and advertises an API key in about 60 seconds via card or x402-based USDC. At the same time, other public snippets still describe the company as “multi-chain payment infrastructure for crypto communities” and as serving both “human users and autonomous AI agents,” which muddies the target customer and the immediate problem being solved. ¹

My central conclusion is blunt: **Coin Railz should not try to become a generic “AI payments platform.”** That category is getting crowded fast by Coinbase/Base/x402, Stripe, Circle, Crossmint, Privy, Halliday, Google/Shopify’s Universal Commerce Protocol, and card-network-led agentic commerce efforts from Visa and Mastercard. Coinbase now offers x402, AgentKit, Base MCP, and Agentic.Market; Stripe supports x402, its own Machine Payments Protocol, and agentic-commerce flows; Circle is assembling a full agent stack with wallets, agent wallets, nanopayments, and a marketplace; Google and Shopify are standardizing agentic checkout with UCP; OpenAI has already launched in-chat checkout for U.S. users with Etsy and Shopify merchants coming next. ²

The strongest strategic direction is narrower and more defensible: **become the compliant monetization, routing, and policy layer for machine-payable proprietary data and tools**, starting with a curated set of high-value verticals where Coin Railz’s existing catalog already points—crypto/risk intelligence, geospatial-earth data, IoT/DePIN signals, and compliance-oriented services. Publicly visible Coin Railz artifacts already show a dual model that can support this: x402 for autonomous agents and prepaid credits/API keys for teams that want to avoid wallet friction. That duality is valuable because even Base’s own x402 flow still notes that every paid request can require approval and a signature, which is not ideal for ultra-frequent micropayments unless the complexity is abstracted. ³

There is also a sharp product-clarity problem. Coin Railz publicly references **66 services** on the homepage and x402 first-call page, **60+ microservices** on the MiCA solution page, **63 tools across 14 categories** in the MCP server repo, **38 services** on MCP Market, and **18 endpoints** in a separate x402 SDK description. That inconsistency is not a cosmetic issue; it tells prospects that the company’s product definition is still unstable. If a buyer cannot easily answer “what exactly am I buying here?” then revenue will stall no matter how good the underlying infrastructure is. ⁴

Finally, Coin Railz appears to have **more technology surface than market proof**. The public footprint shows a canonical first-paid x402 onboarding flow, an MCP server, an npm SDK, AgentKit compatibility, a MiCA-oriented EU landing page, and a large catalog of services. What it does **not** show clearly is comparable evidence of strong developer pull, public customer references, or dominant discovery. The MCP GitHub repo shows zero stars and zero forks in the retrieved snapshot, while broader x402 infrastructure is

now being institutionalized through the Linux Foundation and pushed by Coinbase, Cloudflare, Stripe, and others. That makes “better protocol plumbing” a weak moat by itself. ⁵

What the public evidence shows today

I attempted a public-web crawl of the Coin Railz footprint through indexed pages and externally visible developer artifacts. In this session, the retrievable public surface included the homepage, a MiCA-focused solution page, a canonical x402 “first call” page, at least one service page, the contact/support page, npm package metadata, GitHub repositories, and third-party MCP ecosystem listings. I could **not** reliably retrieve a publicly indexed developers hub, blog index, or public OpenAPI specification through search, despite targeted attempts, which is itself a meaningful discovery problem for a developer-first business. ⁶

Public footprint summary

Public artifact	What it says	Strategic meaning	Evidence
Homepage	“Payment Infrastructure for AI Agents,” 66 pay-per-call services, API key in ~60 seconds via card or x402 USDC	Stronger top-line framing than generic crypto infra; good for first impression	⁷
MiCA landing page	USDC-first, MiCA-compliant framing for EU AI agents, IoT, and DePIN	One of the few concrete ICP-specific angles on the site	⁸
x402 first-call page	\$0.05 onboarding call, HTTP 402 challenge, Base/Ethereum/Solana accepted, onboarding receipt + next-service templates	Good canonical entryptpoint for wallet-native developers	⁹
Service page example	Per-service pricing, x402 endpoint path, chain support	Helpful micro-level product detail exists	¹⁰
Contact page	Support email/phone plus named AML/KYC contact	Compliance/trust signal, but feels manual and boutique rather than platform-scale	¹¹
GitHub MCP repo	63 tools, 14 categories, API-key path, x402 path, AgentKit compatibility	The widest single public description of the product surface	¹²
npm package metadata	“AI Payments SDK” describing payment processing, AI agent marketplace, and compliance infrastructure	Suggests another overlapping narrative beyond the homepage	¹³
Third-party MCP listings	Coin Railz visible in MCP ecosystem; one security scanner gives an “A/100” snapshot	Some ecosystem presence exists, but not yet clear demand leadership	¹⁴

Product identity drift

The company's public positioning is **directionally right but narratively unstable**. On one hand, "Payment Infrastructure for AI Agents" is specific and timely. On the other hand, related public descriptions still frame Coin Railz as a broader crypto community payment layer, as an AI agent marketplace, as compliance infrastructure, and as a very broad payable-service catalog. Those are all adjacent ideas, but they are not the same product in a buyer's mind. ¹⁵

The service-count inconsistency is the clearest symptom of this drift:

Public source	Service count or description	Why it matters	Evidence
Homepage	66 pay-per-call services	Primary top-of-funnel number	¹⁶
MiCA landing page	60+ x402 microservices	Looser figure on a vertical page	¹⁷
x402 first-call page	"Browse All 66 Services"	Confirms homepage number	⁹
GitHub MCP repo	63 tools across 14 categories	Most detailed public inventory	¹²
MCP Market listing	38 services	Third-party marketplace sees a smaller subset	¹⁸
GitHub profile x402 SDK blurb	18 endpoints	A separate public code surface shows a far smaller footprint	¹⁹

This does not mean Coin Railz is overstating anything maliciously. It most likely means the company has evolved through several packaging models—core x402 endpoints, broader API services, MCP-exposed tools, and marketplace-style groupings—without consolidating them into one canonical, buyer-legible offer. Strategically, that is costly because it creates doubt about what is mature, what is experimental, and what is actually supported. ²⁰

API surface analysis

Using the MCP repo as the richest public source, the visible API surface is large and heterogeneous:

Category	Count	What this suggests	Evidence
Trading intelligence	14	Strongest existing wedge by sheer count	¹²
Satellite & earth observation	12	Unusual and potentially differentiated real-world data angle	¹²

Category	Count	What this suggests	Evidence
IoT & DePIN data	5	Clear machine-data direction if curated well	12
Execution & infrastructure	4	Some workflow utility, but not the catalog's center of gravity	12
Banking/finance + enterprise services + agent infra	9 combined	Hints at compliance and infrastructure ambitions, but still relatively shallow	12
Real estate + traditional markets + prediction markets + AI inference	12 combined	Breadth is high, coherence is low	12

That distribution matters. Publicly, Coin Railz looks much more like a **paid data and analysis marketplace** than a full-stack payment processor. Most catalog items are stateless, request-response information services—quotes, telemetry, analytics, scans, odds, scores, imagery, metadata—plus a smaller collection of wallet, bridge, compliance, and consultation functions. In other words, the *observable* product is closer to “machine-payable intelligence and signals” than “enterprise transaction infrastructure.” If the company keeps selling itself primarily as generic payment infrastructure, it risks underselling what its public catalog actually is. ²¹

Website, catalog, and developer experience audit

The website's biggest improvement is that the top-line message is no longer vague. “Payment Infrastructure for AI Agents” is a good headline because it reflects a real macrotrend: x402 is now presented as production-ready, shows recent transaction activity in the tens of millions, and is backed by a Linux Foundation project structure plus support from Coinbase, Cloudflare, and other ecosystem players. Coin Railz is not pitching fantasy infrastructure into a void; it is pitching into a category that is genuinely forming. ²²

Even so, the public site currently appears to do **too many jobs at once**. It is trying to be an x402 provider, a service marketplace, a compliance-forward platform, a crypto/DeFi analytics shop, an IoT/DePIN data network, and a Europe-ready USDC solution. That can work later, but not at the stage where basic trust and discovery still need to be won. The site also seems to rely heavily on search snippets and dynamic surfaces rather than a clearly indexed docs/content engine; targeted searches during this audit kept surfacing the home page, a few solution/service pages, and support, not a deep documentation or thought-leadership corpus. For a developer business, that weakens SEO, onboarding, and credibility all at once. ²³

Developer journey assessment

Journey stage	What is publicly visible	Assessment	Evidence
Discovery	Homepage promise, MiCA page, first-call x402 page, service example, MCP listings	Reasonably legible once someone already knows the problem category; weak broad discoverability	24

Journey stage	What is publicly visible	Assessment	Evidence
First integration path	Canonical x402 first paid call with curl sample	Strong pattern; gives developers a concrete starting point	9
Alternative onboarding path	Buy credits with Stripe or USDC, generate API key, set env var	Smart abstraction for non-crypto-native teams	25
Tooling	npm package, MCP server, Coinbase AgentKit compatibility, ElizaOS plugin on GitHub profile	Correct ecosystem choices for 2026 agent builders	26
Authentication model	X-PAYMENT for x402 and API key/credits for conventional access	Dual-path model is a real strength	27
Friction points	Docs/openAPI not easily surfaced; versioning confusion exists in x402 ecosystem; public product counts conflict	High risk of drop-off before activation	28

This dual onboarding model is one of Coin Railz’s best underappreciated assets. Pure x402 is elegant in theory, but the broader ecosystem still shows real UX friction. Base MCP, for example, explicitly says its current x402 experience is better suited for larger purchases because each paid request still requires approval and a wallet signature. Coin Railz’s prepaid credits and API keys solve that problem for businesses that want the economics of pay-per-use without the wallet choreography on every request. The public messaging does not yet foreground that advantage enough. 29

Pricing is similarly promising but under-packaged. Public service examples and repo docs show a wide pay-per-call range—from \$0.05 for simple IoT readings or first-call AI inference up to \$10 for high-touch enterprise services—with credits purchased via Stripe or USDC. That is sensible at the unit-economics level, but the public pricing story still reads as an **endpoint menu**, not as a **business offer**. Buyers do not usually want 63 separate prices; they want a bundle, a plan, a governed spending model, or a solved workflow. 30

On trust, Coin Railz does show some useful signals: a named AML/KYC contact, a MiCA/USDC landing page, and third-party scan visibility in the MCP ecosystem. But the public footprint I reviewed does not clearly surface the stronger trust markers enterprise buyers usually expect—license identifiers, jurisdiction coverage, case studies, uptime/SLA pages, audit summaries, or prominent customer logos. If Coin Railz has materially better compliance/regulatory assets than a normal startup, the current public site is not monetizing that advantage hard enough. 31

Competitive landscape and market context

The market tailwind is real. x402 is no longer a speculative side project: the official x402 site frames it as an open, neutral, internet-native payments standard, reports tens of millions of recent transactions, and emphasizes zero protocol fees. The protocol has also moved into Linux Foundation governance, and

Cloudflare has publicly added x402 support to its agents and MCP integrations. That means Coin Railz is operating inside a growing standard—not inventing one alone. ³²

But that same momentum creates the competitive problem. Once the protocol is open and neutral, the defensible layer is **not the protocol itself**. It becomes one of five things instead: distribution, exclusive supply, compliance/policy tooling, deep workflow integration, or brand trust in a specific vertical. Coinbase is already moving hard on distribution with AgentKit, Base MCP, an agent wallet stack, and Agentic.Market. Stripe is supporting both x402 and its own MPP while also positioning around UCP and broader agentic commerce. Circle is moving into agent wallets, wallet infrastructure, nanopayments, and an agent marketplace. This is exactly why Coin Railz should stop trying to sell “general agent payment infrastructure” as its whole story. ³³

Competitor comparison

Platform	Public posture	Public pricing signals	What Coin Railz is up against	Evidence
Coinbase / Base / x402	Owns protocol mindshare, wallets, agent tooling, marketplace, and discovery	x402 advertises zero protocol fees; Base MCP and AgentKit are ecosystem entrypoints	Most direct threat on x402 distribution and default discovery	³⁴
Stripe	Accepts stablecoins, supports x402 and MPP, supports agentic commerce via UCP/ACP paths	Stablecoin payments settle in local currency; exact enterprise rates vary; public docs available	Massive merchant/ compliance/ distribution power; stronger for consumer and seller checkout flows	³⁵
Circle	Wallets, agent wallets, full-stack platform, agent marketplace, compliant USDC/EURC	Wallets historically from \$0.05 monthly active wallet with free tier/rebates	Strong regulated-stablecoin and wallet-platform competitor	³⁶
Crossmint	Agentic payments, wallets, cards/ stablecoins, policy controls, compliance	1,000 free MAWs; overages from \$0.05/ MAU	Stronger wallet/policy/ commerce abstraction than Coin Railz today	³⁷
Privy	Embedded and server wallets, treasury and agent-wallet positioning, large account scale	Free to 499 MAU, then paid monthly tiers	Stronger developer-wallet UX and transparent pricing	³⁸

Platform	Public posture	Public pricing signals	What Coin Railz is up against	Evidence
Halliday	Workflow protocol, onramp/bridge/swap orchestration, 7-line integrations	Pricing not publicly standardized in retrieved sources	Stronger on cross-chain workflow abstraction and fiat-to-crypto routing	39
Coin Railz	Pay-per-call x402 and credit-based services, 60+ services, niche data catalog	\$0.05–\$10 per call visible publicly; credits via Stripe or USDC	Better positioned as a curated machine-data monetization layer than as a generic rails company	30

The macro opportunity is also real—but nuanced. Stablecoins are big enough to matter, yet a large share of stablecoin activity is still not “real payments” in the everyday business sense. Visa reports more than \$272 billion in circulating stablecoin supply and about \$10.2 trillion in adjusted transaction volume over the last 12 months, while BCG argues that “real economic activity” is much smaller than raw onchain transfer numbers suggest. That means Coin Railz should not blindly optimize for gross chain volume narratives; it should optimize for **high-intent business workflows** and measurable buyer outcomes. 40

On the agent side, the enterprise adoption wave is also credible. Gartner said up to 40% of enterprise applications would include task-specific agents by 2026, and more recently warned that up to \$234 billion in enterprise application spend is exposed to agentic arbitrage through 2030. McKinsey’s 2025 AI survey and 2026 trust work both point to a move from experimentation toward scaled deployment with stronger concerns around governance and autonomy. Those are excellent conditions not for another raw payments startup, but for a company that helps enterprises **govern and meter** agent spend and paid tool usage. 41

Adjacent-vertical assessment

Vertical	Market signal	Fit with current Coin Railz surface	Verdict	Evidence
Crypto, market intelligence, risk data	Existing service concentration is highest here	Strong fit; easiest near-term monetization	Primary wedge	12
Geospatial, satellite, IoT, DePIN	Coin Railz already exposes NASA/ESA and IoT/DePIN categories; DePIN raised about \$1B in 2025	Strong differentiation if curated and commercialized properly	Primary wedge	42
Enterprise agent spend control / procurement	Strong enterprise agent adoption and governance demand	Excellent monetization potential if Coin Railz adds policy and audit layers	Primary wedge	43

Vertical	Market signal	Fit with current Coin Railz surface	Verdict	Evidence
Consumer shopping / checkout	Google, Shopify, OpenAI, Stripe, Visa already moving aggressively	Low fit, brutal competition, weak moat	Do not prioritize	44
Generic wallet infrastructure	Crossmint, Privy, Circle, Coinbase already strong	Commodity trap for Coin Railz	Do not prioritize	45
Robotics / machine telemetry	Industrial robot deployments are large and rising; machine-driven operations are real	Interesting long term; sales cycles longer than Coin Railz should absorb right now	Secondary, partner-led	46
Gaming	Agentic and onchain commerce can matter, but giants are shaping consumer rails first	Could work later, but current public surface is not gaming-native enough	Tertiary	47

Developer sentiment reinforces that this market is early but active. On the positive side, Hacker News and Reddit show genuine builder interest in x402, including excitement about API-key-less monetization and guides for integrating x402 with agents. On the negative side, developers also explicitly complain that documentation is confusing because of v1 versus v2 differences, and some comments question whether the real use cases and governance model are fully clear yet. Coin Railz should read that as an opportunity: **simple, opinionated onboarding and policy tooling are valuable precisely because the ecosystem is not yet easy by default.** 48

Strategic diagnosis

The brutal truth is that Coin Railz looks like a company that has built **too much surface area before locking a single dominant buyer narrative**. That is not fatal. In fact, many infrastructure companies reach this phase. But it does mean the right move now is not “add more categories.” It is to turn today’s broad platform into a much more legible business with one primary buyer and one primary reason to buy. 49

SWOT

Dimension	Assessment	Why this matters	Evidence
Strength	Large public catalog, dual auth/payment model, x402-native onboarding, timely market theme	There is real product substance here	50
Strength	Compliance-forward public posture, MiCA/USDC framing, named AML/KYC contact	Better trust posture than many hackathon-style agent products	51

Dimension	Assessment	Why this matters	Evidence
Weakness	Product identity drift and inconsistent service counts	Buyers cannot quickly understand the offer	52
Weakness	Public discovery/content footprint appears thin; docs/OpenAPI not easily found	Hurts SEO, activation, and developer confidence	23
Weakness	Public community traction appears low	Makes “ecosystem leadership” hard to claim	53
Opportunity	Enterprises need spend governance, audit, and agent-safe policies	This is better monetization than long-tail endpoint sales	43
Opportunity	Real-world paid data for agents is still under-served	Coin Railz already has unusual catalog ingredients	12
Threat	Protocol and distribution are being colonized by giants	Generic “agent payments” is a losing battlefield for a smaller firm	54

Recommended pivot set

Strategic option	Fit with current assets	Competitive pressure	Revenue quality	Recommendation	Evidence
Stay a broad x402 service marketplace	Medium	Very high from Coinbase Agentic.Market and protocol-level directories	Weak to medium	No	55
Become a generic wallet infrastructure provider	Low	Very high from Crossmint, Privy, Circle, Coinbase	Medium	No	45
Become consumer/merchant agentic checkout rails	Low	Extremely high from Stripe, Google, OpenAI, Visa	High but unrealistic	No	44
Become a compliant monetization gateway for machine-payable data/APIs	High	Medium	High	Yes	56

Strategic option	Fit with current assets	Competitive pressure	Revenue quality	Recommendation	Evidence
Become an enterprise policy and spend-control layer for agent payments	Medium to high	Medium	Very high	Yes	57
Package curated vertical intelligence bundles	High	Medium	High	Yes	12

In business terms, the recommended direction is this:

Coin Railz should become a two-sided B2B platform for machine-payable intelligence, with enterprise guardrails.

One side is the **provider**: proprietary APIs, datasets, and tools that want monetization, metering, and agent-friendly distribution.

The other side is the **buyer**: agent builders and enterprises that want paid data and tool access with budgets, allowlists, approvals, receipts, and compliance exports.

The payments rail remains important, but it becomes an enabler—not the whole product. That is where defensibility can actually form. 58

The go-to-market implication is equally clear: Coin Railz should sell **fewer categories and more outcomes**. Instead of leading with “66 services,” it should lead with three offers such as: **Crypto Intelligence Pack**, **Geospatial and IoT Signal Pack**, and **Enterprise Agent Spend Control**. Those are SKUs a buyer can understand. The current endpoint catalog can remain underneath, but the homepage and sales motion should stop asking the customer to reverse-engineer the company. 59

Recommendations and action plan

Priority recommendations

Move	ROI	Effort	Why now
Collapse public messaging into one buyer story	Very high	Low	Positioning confusion is the first bottleneck
Publish one canonical service inventory and one canonical docs entry	Very high	Low to medium	The current count inconsistency undermines trust
Productize vertical bundles instead of raw endpoint sprawl	Very high	Medium	Buyers purchase workflows and packages, not inventory lists
Make credits/API-key mode the default business path and x402 the native-agent path	High	Low	This turns a hidden strength into a sales advantage
Build policy controls, allowlists, budgets, and audit exports	High	Medium	This is where enterprise ARPU and defensibility live
Offer provider monetization tooling for third-party APIs	High	Medium to high	Creates two-sided network effects

Move	ROI	Effort	Why now
Keep adding long-tail endpoint categories	Low	Medium	Increases confusion faster than revenue
Compete head-on in consumer checkout	Very low	High	Giants already occupy that lane

Pricing and monetization redesign

Coin Railz's current public pricing reads like a menu. The redesign should move toward **three layers**:

Revenue layer	Model	Why it is better than endpoint-only pricing	Evidence base
Provider monetization SaaS	Monthly platform fee for pricing, billing, receipts, analytics, and distribution	Creates predictable revenue and locks in supply	60
Enterprise policy layer	Seat or workspace subscription for budgets, allowlists, approvals, audit exports, and spend controls	High-ARPU recurring revenue tied to governance, not raw traffic	61
Usage take rate	Small % take on paid calls or bundled credit consumption	Preserves upside from network growth without depending only on SaaS	27

Illustratively, if Coin Railz pivots toward provider SaaS plus enterprise governance instead of pure endpoint vending, the shape of revenue can improve materially. The table below is **illustrative, not predictive**, because internal traffic, win rates, and margins were not available in this research.

Scenario	Assumptions	Illustrative annualized revenue
Conservative	15 providers at \$1,000/mo, 8 enterprises at \$2,500/mo, \$1M annual usage volume at 3% take rate	\$450,000
Base case	40 providers at \$1,500/mo, 20 enterprises at \$5,000/mo, \$5M annual usage volume at 3% take rate	\$2,070,000
Upside	100 providers at \$2,000/mo, 40 enterprises at \$10,000/mo, \$20M annual usage volume at 4% take rate	\$8,000,000

The arithmetic for those scenarios is shown here.

Recommended 12-month revenue mix

The chart above is a strategic recommendation, not a report of current revenue. It reflects the reality that protocol rails and point endpoints are easier to commoditize than governance, buyer trust, and proprietary supply. That logic is consistent with where the broader market is moving: open payment standards, marketplace discovery, and increasing enterprise concern about governance and control. ⁶²

Partnership and customer targets

Coin Railz's highest-value partnerships are not the same as its highest-value customers.

Priority partnership targets should be ecosystem channels and enablers: Coinbase/Base tooling, Cloudflare Agents and MCP deployments, Circle wallet/USDC infrastructure, and wallet-control players such as Crossmint or Privy where Coin Railz can sit above the wallet as the monetization-and-policy layer. These companies already attract the builders that Coin Railz needs, and x402 is being wired into their stacks directly. ⁶³

Priority customer targets should be:

- proprietary API and dataset owners in crypto analytics, compliance/risk, geospatial, and IoT/DePIN;
- enterprise AI teams in fintech, logistics, energy, insurance, and operations that need governed access to paid external data/tools;
- agent builders already living inside MCP, AgentKit, or x402 ecosystems who need curated, reliable, paid supply rather than another wallet or another protocol explanation. ⁶⁴

Action plan

Over the next 30 days, Coin Railz should rewrite the homepage and nav around a single point of view: “the compliant monetization and spend-control layer for machine-payable data.” It should publish one canonical service inventory, one crawlable docs home, a public OpenAPI or equivalent machine-readable spec, and three flagship bundles. It should also explicitly explain when to use **credits/API keys** versus **x402**, because that is a real advantage today. Public trust assets—licensing disclosures if applicable, case studies, provider logos, compliance jurisdiction notes, and uptime/support commitments—should move from implied to explicit. These are low-to-medium-effort changes with disproportionate commercial impact because they attack current confusion directly. ⁶⁵

Over the next 90 days, Coin Railz should launch a provider-facing monetization gateway and an enterprise-facing policy layer in beta. The provider product should handle metering, pricing, receipts, payout/accounting hooks, and x402-or-credit access. The buyer product should handle budget caps, service allowlists, human approval thresholds, PII-safe request metadata filtering, and exportable receipts/audit logs. This is exactly the kind of layer the x402 ecosystem still leaves open, and adjacent research already points to demand for policy enforcement and metadata safety in agentic payments. ⁶⁶

Over the next year, the goal should be to become the default B2B control plane for machine-payable intelligence in a few chosen verticals, not the largest undifferentiated marketplace. Success would look like a smaller number of high-quality providers, repeat enterprise buyers, visible design partners, and a revenue mix tilted toward provider SaaS plus enterprise governance rather than unpredictable long-tail call volume. In that world, Coin Railz does not need to beat Stripe, Coinbase, or Circle at their own game; it only needs to become indispensable in the layer they do not own. ⁶⁷

The strategic direction, then, is clear. **Coin Railz should stop trying to be interpreted as a broad AI-payments company and start being purchased as a focused machine-data monetization and governance platform.** The technology already points in that direction. The market structure increasingly rewards it. What is missing is the discipline to package, narrow, and sell it that way. ⁶⁸
