

MONEY RAILZ SKETCH EXPLAINED

TRAVIS KELLOGG

Page 1: Welcome Screen

- **Sign-In Options:** Users have the option to "Sign In" if they already have an account, "Sign Up" to create a new account, or "Continue as Guest" to access limited functionality (specifically the DEX aggregator).
 - **Guest Access:** Allows users to access certain features (like the DEX aggregator) without creating an account, which could increase accessibility for new users.
 - **Design Observation:** The simplicity is user-friendly and caters to both registered users and first-time guests, supporting easy onboarding.
-

Page 2: Sign Up / Create Profile

- **Account Creation:** Users enter their email, create a password, and confirm it to set up an account.
 - **Profile Details:** After creating login credentials, users proceed to a profile setup where they provide personal information like first name, last name, mobile number, and email.
 - **Optional Payment Connections:** Users can connect accounts like Cash App, Venmo, PayPal, Apple Pay, Google Pay, and Zelle, aligning with the platform's goal of enabling cross-platform payments.
 - **Security Measure:** There's a verification process using either the mobile number or email to send a verification code.
 - **Design Observation:** This profile setup covers essential user details and verifies identity. Including optional payment connections upfront is convenient and aligns with your platform's interoperability goals.
-

Page 3: Main Menu After Login

- **Action Options:** Logged-in users are presented with four main options:
 1. **Send Money:** Likely initiates the cross-platform transfer functionality.
 2. **Buy (On-Ramp):** Allows users to convert fiat to crypto.
 3. **Sell (Off-Ramp):** Enables users to convert crypto to fiat.
 4. **Swap (DEX):** Access to decentralized exchange functionality.
 - **Design Observation:** This structure organizes key functionalities clearly, allowing users to navigate directly to the core services Money Railz offers.
-

Page 4: Send Money Screen

- **Sender's Information:** The user selects a payment method (Cash App, Venmo, PayPal, etc.) and enters their username for the chosen method.
 - **Recipient's Information:** The recipient's preferred method and username are selected similarly.
 - **Float Account:** Indicates that funds are sent to a "float account" before being distributed to the recipient, facilitating cross-platform transfers.
 - **Design Observation:** This setup aligns with the platform's intermediary role in cross-platform transfers. However, it might be beneficial to provide additional guidance here to ensure users input accurate information, reducing failed transactions.
-

Page 5: Buy/Sell (On-Ramp/Off-Ramp) Screen

- **Integrated Solutions:** For both "Buy" (on-ramp) and "Sell" (off-ramp), the design notes integration with providers like Transak or Ramp Network.
 - **Design Observation:** Using established providers for on/off ramping is practical and streamlines the process, leveraging their compliance and infrastructure. This approach minimizes the complexity for Money Railz, focusing on integration rather than building these services from scratch.
-

Page 6: Swap (DEX Aggregator) Screen

- **DEX Aggregator:** Standard DEX aggregator functionality with fields for selecting the chain (default is Ethereum), sell amount, buy amount, and assets to swap.
- **Multi-Chain Support:** Notes potential for multi-chain functionality, with future plans to expand beyond basic swap operations.
- **Guest Access:** This is the screen guests see if they choose "Continue as Guest" from the welcome page, providing limited but functional access.
- **Design Observation:** A DEX aggregator with multi-chain support broadens platform appeal and allows users flexibility. Allowing guest access here is a good way to attract new users who may register after exploring this feature.

ANALYSIS (SO FAR)

1. **User Flow:** The user journey is straightforward, moving from login/sign-up to core functions (send, buy, sell, swap). This logical progression will make it easy for users to understand and navigate the platform.
2. **Cross-Platform Functionality:** The integration of multiple payment methods and the float account system for send/receive transactions clearly addresses cross-platform interoperability, which is a core value proposition of Money Railz.
3. **Onboarding and Security:** Requiring basic information and a verification code during sign-up adds a layer of security without being overly complex. For enhanced security, we may add optional two-factor authentication (2FA) in future iterations.
4. **Guest Access:** Allowing guests to use the DEX aggregator will introduce new users to the platform's value. I will add a call-to-action or reminder for guests to register to access additional features.
5. **Compliance:** Given the integrations with Transak or Ramp Network, compliance requirements (like KYC/AML) may already be partially handled by these providers. However, ensuring that Money Railz also meets regulatory standards for user verification will be crucial.
6. **Additional Guidance for Users:** The "Send Money" screen will include a tooltip or helper text to remind users to double-check recipient information (e.g., usernames). This can help avoid errors during cross-platform transactions.
7. **Future Enhancements:** Multi-chain DEX aggregator functionality and additional services beyond simple swaps will add value for advanced users. These features will be prioritized as the platform grows.
