

Coin Railz – Executive Summary

USDC-Native Payment Infrastructure for AI Agents & Cross-Chain Commerce

Coin Railz is a production USDC-native payment infrastructure platform focused on powering autonomous AI agents and cross-chain commerce through programmable settlement.

We operate 58 live x402 microservices settling exclusively in USDC across Ethereum, Base, and Solana. These services support machine-native, pay-per-call transactions, enabling AI agents to programmatically purchase data, compute, and services using stable digital dollars.

The structural shift:

AI agents transact programmatically. Legacy rails are not machine-native. Multi-chain ecosystems fragment liquidity. A programmable, regulated digital dollar becomes the natural settlement layer.

Why USDC:

USDC is regulated, fully reserved, natively issued across major chains, and built with developer-first primitives. Coin Railz is designed to drive USDC transaction velocity, not speculative token activity.

Traction (production):

- 58 USDC-settling services live
- USDC payments processed
- 13,287 x402 interactions (30 days)
- 2,327 agents discovered
- Multi-chain settlement active (Ethereum, Base, Solana)

Business Model:

- Micro-fees on x402 endpoint usage
- Embedded fiat → USDC on-ramp margin
- Cross-chain routing (CCTP-enabled flows)
- Future enterprise API licensing

Regulatory & Operational Foundation:

Coin Railz operates with compliance-first discipline. Founder Travis Kellogg also operates Kellogg Holdings LLC, holder of an Alabama Money Transmitter License, with principal-to-principal digital asset settlement experience and established U.S. banking relationships.

Raise:

Coin Railz LLC is raising \$1,000,000 via post-money SAFE (YC standard) at a \$10,000,000 valuation cap. Funds will be used to complete embedded on-ramp integration, expand

engineering capacity, accelerate developer adoption, and integrate cross-chain settlement infrastructure.

Vision:

Build the default USDC-native payment layer for autonomous commerce and drive measurable USDC transaction velocity growth across chains.
